Basics of computer pdf notes

An Xerox researcher has an issue he wants to discuss with a colleague, so he steps across the room from his office. As two of them brain on a whiteboard, a third colleague notices their activities and decides to release in. She left the meeting after a few minutes, then there's an idea she thinks could help. He jots it down on a post-it note and leaves it on one of the walls. Interactions like this happen all day in workplaces around the world. What makes these particular interactions different is that the three workers are thousands of miles apart. They work in virtual offices, walk down virtual layers, write on a virtual whiteboard. Post-read notes? You guess it: virtual. These Xerox researchers are working in Jupiter, the most exotic and advanced collection of community-based systems under the development of the Palo Alto Research Center (PARC). There are no Jupiter errors for traditional technology compliance. It is not about e-mail, relationship databases, or other information systems that help people organize and access reality. Jupiter is a social system — a network location designed to allow colleagues, regardless of physical location, to share and create ideas. Jupiter is virtual social reality, says John Wely Brown, PARC's director and chief scientist Xerox. It's a system to support the organizational leader. Jupiter is the task of a handful of PARC researchers led by Curtis Pavel, a 35-year-old computer scientist. It has long hair and a beard and works out of a crowded, kooky-like office — just what you'd expect from PARC. In fact Curtis is something of a culture figure in computer circles, a hacker best-known for his terrestrial work on MUDs (Multi-User Dungeons) and MOOs (MUDs, object-oriented), two of the Internet's strongest technology and dynamic technologies. MUDs were created at the end of the 1970s to support interactive adventure games. Participants build their own electronic world, adopt new identities, dig for treasures, or fight wars. As MUDs got more elaborate, players used to write software to make their games more exciting. MUDs have become a programming tool. MOOs are a subset of MUDs. They use object-oriented programs to make the code-writing easier and the environment more robust. Curtis himself is best-known as the creator of LambdaMOO, which he revealed in January 1991. LambdaMOO is a virtual world inhale primarily by college students. Participants play games, discuss homework, and interact in ways that students everywhere react. LambdaMOO is an enough community, albeit one built on hundreds of thousands of computer lines, most of it written by its members. MOOs are very compelling, says Curtis, who has LambdaMOO identity is Archwizard Haakon. They engage people in a very active way. He says it's not all that great a leap to college students discussing duties of engineers crossing ideas about new products. So was born Jipiter. On the computer screen of the in me the window range that conjoins the memory of the Hollywood Squares or the opening credits of the Brady Bunch. Occupy these squares, though, are ordinary people-looking in ordinary offices — looking at what people do: sitting at their desks, talking on the phone, hitting on their computer keyboard. They are Xerox researchers and engineers among the daily activities. They are those who work in Jipiter. Ki distinguished Jupiter from traditional computer systems is what bases it in the physical world. Jupiter's room offers circulation on what kind of behavior is appropriate. A dispute over one private office discussion is more informal than that, say, discussion groups in one of Jupiter's virtual laboratories. And people are not free to access their colleagues at will. Each video square has an icon indicating how interoperable someone wants to be. An open door means colleagues should feel free to double-click and enter. A containment is an electronic no-disrupt sign. People want to be limited, says John Wely Brown. They want to know what to expect from them. So different social protocols get tangled in different places. It gives you the feeling of being 'grounded' and a willingness to communicate in natural ways. Equally as important as these social protocols are the Jupiter tools incorporated to enable productive collaboration and focused conversations. Jupiter's virtual whiteboards, fax machines, tape recordings, and messenger systems provide all the functionality of the physical tools — but without limitation. I was watching Jipiter from the outside — now it's time to step inside and become a player. I'm late for a meeting with someone on the other side of the building. I clicked to square it and see it on the phone. So I typed a note to let him know me on my way. I drag the note to his window and click. These words, You pass the note to Mike appeared on the screen — the narrative produced by the omniscient Greek chorus, event-driven program that provides a comment running on the action. Mike is still on the phone. Give me a wave and get to come. Fewer than 60 people now use Jupiter, mostly researchers at PARC and its sister lab in Grenoble, France, as well as engineer Xerox in Rochester, New York. But for this core group, the system has become an essential part of their day-to-day work experience. A team of engineers report that Jupiter played a major role in how they prototyped a new product, an internet bill and credit-authorization system. Most everyone uses it for routine activities such as tracking down hard-to-reach colleagues. And people look forward to the brain serendipity Jupiter allows, as the striking of a friend takes a break in the room - a friend who happens to be on the other side of the country. Jipiter is still an experience, not quite ready for the first time. But his technical headaches are becoming less pain every day. Meanwhile, in Jupiter continues to grow. We've never tried to acquire users, Curtis says. Instead we had the 'disaster problem' success — people keep coming at us and saying they really want to use it. So Curtis and his colleagues are working on strategy rolls. This fall, PARC plans to release a version of Jipiter designed to run on personal computers — opening it up to a larger population inside Xerox. Curtis is looking forward to it: That's when we'll learn what these systems are really good for. As opposed to most typist applications, which require you to copy the words you see on-screen, Listen and Write play back audio clips of current event and ask you to transcribe the content. Sometimes the application is a little too upset about spelling — especially in proper names — but that could be a great tool for cause up for taking better and faster notes at conferences or meetings. On the other hand, if you'd like your computer to dictate what you're saying, we've got you covered there, too. You've been talking to (or crying in) Your Windows PC for years, but unless you wanted to... Read more and write [through Digital Inspiration] I've been blinging my first job from college to headquarters to a major computer manufacturer. As part of my orientation, the human resources manager took me on a trip to the entire facility, including the factory floor. It was there that I first started to understand the shepherd's enthusiasm of the tasks involved in doing computers. Hundreds of people mourn in forehead, assemble parties, assemble elements, at a hum stop of activities designed to safeguard our desire for digital tools and games. It's almost hard to believe that the end result of all that works and material costs, at most, maybe a couple of thousand dollars. Seeing it up close not only helped me appreciate the materials that go to each machine, but also the sweat and hard work of every person on the factory lines. Arthur, Charles.
